

# CR timer

## BA225 / BA225F / BA235 / BA226 / BA226F / BA236

The BA225, BA225F, BA235, BA226, BA226F, and BA236 are monolithic ICs having independent monostable multi-vibrator circuits which consume very low current (0.75mA typ.). Using external resistors and capacitors, the timing control time can be set within a range from 0.01ms to 100ms.

As the BA225, BA225F, and BA235 are triggered at the rising edge of the signal, they have no trigger input differentiating circuit and can be used in measuring instruments, control devices, digital data systems and other equipment as sub-compact attachments. The BA226, BA226F, and BA236 are available as falling edge trigger types.

### ●Applications

Delay timers

Monostable multivibrator (ideal for VCR system controllers)

Pulse generators

### ●Features

- 1) As these are edge trigger types (BA225 / BA235: rising edge trigger types, BA226 / BA236: falling edge trigger types), there is no need for an input differentiating circuit.
- 2) The dual type design enables delay timer configuration.
- 3) Fewer attachments are required.
- 4) Current dissipation is as low as 0.75mA for each circuit.
- 5) Uniformity in the supply current between high and low output states simplifies the design of the power supply section.
- 6) Wide operating power supply voltage range of 4.0V to 16V.
- 7) The BA235 and BA236 pin assignments are symmetrical, allowing reverse insertion.
- 8) Hysteresis in the input results in a high level of noise withstand resistance.

### ●Block diagram

● Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	V <sub>CC</sub>	16	V
Power dissipation	BA225 / BA226	800*1	mW
	BA235 / BA236	950*2	mW
	BA225F / BA226F	450*3	mW
Operating temperature	T <sub>opr</sub>	- 20 ~ + 75	°C
Storage temperature	T <sub>stg</sub>	- 55 ~ + 125	°C

\*1 Reduced by 8mW for each increase in Ta of 1°C over 25°C.

\*2 Reduced by 9.5mW for each increase in Ta of 1°C over 25°C.

\*3 Reduced by 4.5mW for each increase in Ta of 1°C over 25°C.

● Electrical characteristics (unless otherwise noted, Ta = 25°C, V<sub>CC</sub> = 5V)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Conditions	Measurement circuit
Operating power supply voltage	V <sub>CC</sub>	4.0	5.0	16.0	V	—	Fig.7
Quiescent current	I <sub>Q</sub>	—	1.5	3.0	mA	—	Fig.7
Timing accuracy	T <sub>ERR</sub>	—	1	10	%	R = 100kΩ, C = 0.1μF*1	Fig.7
Timing change with power supply	T <sub>DS</sub>	—	0.5	3.0	%	5V→16V	Fig.7
Timing change with temperature	T <sub>OT</sub>	—	200	—	ppm / °C	—	Fig.7
Trigger voltage	V <sub>T</sub>	1.0	2.0	3.0	V	*2	Fig.7
		0.7	1.6	2.5			
Trigger current	I <sub>T</sub>	—	70	200	μA	V <sub>T</sub> = 3.0V (BA225 / BA235) V <sub>T</sub> = 2.5V (BA226 / BA226F / BA236)	Fig.7
Output low level voltage	V <sub>OL</sub>	—	0.5	1.0	V	I <sub>SINK</sub> = 5mA	Fig.7
Output high level voltage	V <sub>OH</sub>	3.0	4.0	—	V	I <sub>SOURCE</sub> = 5mA	Fig.7

\*1 One-shot cycle T = 0.5 CR

\*2 With input hysteresis (hysteresis width = 200 to 600mV)

●Measurement circuit

Fig. 7

●Attached components

- (1) Timing capacitors (Pins 2 and 6)  
Connected between these pins and the ground (GND), this capacitor determines the one-shot period. We recommend using a capacitor with a value greater than 1000pF. The one-shot cycle is determined by  $T = 1 / 2 C \cdot R$ .
- (2) Timing resistor (Pins 2 and 6)  
Connected to the power supply line, these resistors determine the one-shot period. The timing capacitor is charged through this resistor. The recommended range for the timing resistor is 10kΩ to 1MΩ.

- (3) Power supply capacitor (Pin 8)  
Connect a 0.02µF capacitor between the power supply pin and the ground (GND) so as to prevent malfunction resulting from a rise in the impedance of the power supply line.
- (4) Load (Pins 1 and 7)  
A load of up to 5mA can be accommodated for both the inflow current and the outflow current.

### ●Operation notes

#### (1) Usage range for voltage

The recommended voltage range is 4.0V to 16V. Use of these ICs at 3.0V or lower voltage may cause the same mode as the input trigger signal to be output at around 2.6V.

#### (2) Input trigger

The input trigger level is 2.0V. The LOW level is 1.0V or lower and the HIGH level is 3.0 V or higher. Trigger signals of 10ms / V or lower should be used for both the rising and falling edges.

#### (3) Time constant determining C • R

The recommended value for the timing capacitor is 1000pF or more and that for the timing resistor is from 10kΩ to 1MΩ.

### ●Application example

Figure 8 shows an example of the circuit including these ICs, while Figure 9 shows the basic operation timing chart. Figure 10 shows the basic operation timing chart of the falling edge trigger type IC. When no trigger signal is applied, the output is in the LOW state and the timing capacitor is in the discharged state. When a trigger signal is applied, its rising edge causes the output to become HIGH and the timing capacitor to be charged.

The charging time of this timing capacitor is determined by the time constants of the external timing resistor and the timing capacitor. When the charged voltage reaches  $0.4 \times V_{CC}$ , the flip-flop in the IC is reset and the output state changes from HIGH to LOW. At the same time, the timing capacitor is discharged to be ready for the next operation.

The voltage, which is determined by comparison of discharge resistance and the timing resistance in the IC, remains on the CR pins. If timing resistance is set at 5kΩ or less, this voltage will reach threshold level ( $0.4 \times V_{CC}$ ), and operation will come to a halt. Also, when timing resistance is set to a low value, voltage remains on the CR pins, which shortens the time constant. If timing resistance is set to 2MΩ or higher, the IC's internal comparator cannot be driven, which may bring operation to a halt.

(4) Note that pin connections and pin arrangements on the BA225 / BA226 (BA235F / BA226F) differ from those on the BA235 / BA236.
